

Vouchins – Developer Setup Guide

Purpose

This document helps new developers get the Vouchins codebase running locally. It focuses only on what is required to contribute safely without exposing sensitive or production-only details.

Prerequisites

- 1 Node.js 20.9 or higher
- 2 npm or yarn package manager
- 3 Supabase account (development project)
- 4 GitHub access to the repository

Project Setup

- 1 Clone the repository from GitHub.
- 2 Install dependencies using npm install.
- 3 Create a Supabase project for local development.
- 4 Run the provided SQL migration to initialize the database schema.

Environment Variables

Create a .env.local file with the following values obtained from your Supabase project:

```
NEXT_PUBLIC_SUPABASE_URL NEXT_PUBLIC_SUPABASE_ANON_KEY  
SUPABASE_SERVICE_ROLE_KEY
```

Running the App

- 1 Start the development server using npm run dev.
- 2 Open http://localhost:3000 in your browser.
- 3 Sign up using a corporate email domain configured in the companies table.

Important Notes

- 1 Passwords are handled only by Supabase Auth.
- 2 OTP verification is mandatory before access.
- 3 Most authorization rules are enforced at the database (RLS) level.

Support

For issues related to setup, ensure the database migration is applied correctly and that environment variables match your Supabase project.
